

Orizon Agents — Week 4 · Technical Documentation & Demo Evidence

What shipped in Week 4 on Stellar testnet — escrow v2 and the money path working end to end, and the ecosystem validation package — how to verify it live, and, plainly, what is still open.

Programme	Stellar Instawards (Cohort 2026) — Blue Belt Instaward Sprint
Milestone	M4 · Week 4 — Ecosystem Validation Package (Deliverable D4 , Epic 5)
Sprint week	Mon 2026-09-28 → Fri 2026-10-02 · evidence assembled 2026-10-03
Network	Stellar testnet only
Team	Danielle Bagaforo Meer — lead engineer (GitHub ALGOREX-PH) Rieselle Saure ("Rie") — PM + QA (GitHub rie-hash14)
This week	42 pull requests merged · 2,718 commits on main · 1,801 commits authored by the lead engineer in the sprint week, 403 by QA
Live application	https://orizons.xyz · API https://orizon-agents-be-stellar.onrender.com/docs

What is still open — QA sign-off, outside payments, open defects	p. 19

How to read this. Each step names the page to open, top right, and what to look for. Every URL here is a live link. Every screenshot is of the live deployment or a public GitHub or Stellar Expert page: the close-ups in this folder and the full-page frames borrowed from ../screenshots/ were captured on 2026-10-03, and three frames of the live plan card and receipt on 2026-09-30, for the public evidence index — each caption gives its own source and time. No wallet was connected and nothing was signed, paid or submitted for any of them. The settlements and dispute credits shown are the team's own test runs, in testnet XLM.

The live application, the API, the evidence and the repositories

Everything below is public. The application and the API run on Stellar testnet; the documentation lives in the public GitHub repositories. Nothing here needs a login.

Listing an agent on Orizon, as an outside operator does

Anyone with a Stellar wallet can register an agent on Orizon — the registry needs only the owner's signature, no permission from us. Week 4 published the guide that takes a newcomer through it, and the figures that show who has.

A1 Read the guide

orizons.xyz/guide/list-your-agent

From nothing to a routed, paid agent on testnet: install a wallet, fund it from friendbot, choose an agent id, skills and price, register on the dApp or through the API, deploy an agent — the copyable reference agent is MIT-licensed — bind its endpoint, pass the readiness check, read the reputation. Every command sample is checked against the live API's schema before the page builds, and the page names the backend commit it was verified against.

It is labelled a **draft**, honestly: the team has checked every step, but someone new to Orizon has not yet followed it end to end.

ORIZON

PLATFORM ▾RESOURCES ▾GUIDE

CONNECT WALLETLAUNCH APP

— OPERATOR GUIDE

List your agent on Orizon

Register an agent on Orizon (Stellar testnet), bind your HTTPS endpoint, get routed and paid, and read your reputation. Every command included.

• Draft — not yet validated by a newcomer. The steps below have been checked by the team but not yet followed end to end by someone new to Orizon.

VERSION	HOSTED AGAINST	UPDATES	NETWORK
1.1.0	Joh1net	September 30, 2026	testnet

READING THE CODE BLOCKS

Runs live

Runs as written against the public testnet backend. Nothing of yours is needed.

Runs offline

Runs on your own machine without calling Orizon, for example to build or check a signature.

Needs your key

Needs something only you have, such as your secret key, account or endpoint, filled in before it runs.

Expected response

What the sample above it prints when it works. Your ids and times will differ.

Each block has a Copy button and a # link you can share.

This guide takes you from nothing to an agent that Orizon's orchestrator routes work to, on Stellar testnet. The path is nine steps, and each one says what you should see and what to do if it goes wrong:

install a wallet → fund it from friendbot → register an agent → deploy your agent → bind an endpoint → check readiness → get routed → get paid → check your reputation

It was written from the operator friction log (backend `docs/operators/friction-log.md`, entries F-001 to F-035), not from memory. Wherever a newcomer got stuck, the step says so, and the [Friction log coverage](#) appendix maps every entry to the place that answers it. Story 1.07's own friction log for the first external registration was never filled in. The backend repository only ever held its blank template, added in commit `7f77a13` and removed from `main` since; every branch that still has the file has that same blank copy. The registration friction here therefore comes from the UAT team's registration QA (story 6.01) and the 5.02 onboarding log, which carries those findings forward.

NOTE

The fastest path is the reference agent (story 2.04): <https://github.com/B10cksmiths/Orizon-Agents-Example-Agent-Stellar>. It is one Python file that already verifies the dispatch signature, checks the envelope and answers in the right shape, with a Render Blueprint to deploy it. This guide deploys it in [Step 4](#). You can replace its work function later.

Before you start #

You need:

- A desktop browser that can install extensions: Chrome, Brave, Edge or Firefox. Phones are not covered by this guide.
- Your own GitHub account (to fork the reference agent) and your own free Render account (to deploy it). Both must be yours: an agent deployed or registered from someone else's account is theirs, not yours.
- Two or three distinctive words for what your agent does, for example `appraisal` or `condition_grading`. These become your agent's skills, and they decide whether the planner ever picks it. Generic words such as `analysis` or `helper` compete with everything and win nothing.
- Nothing else. No money, no mainnet wallet, no personal data. Everything here is on testnet.

One API, two hostnames #

The dApp at <https://orizons.xyz> forwards every `/api/*` request to the Orizon backend, which also answers directly at <https://orizon-agents-be-stellar.onrender.com>. They are the same service. Older documents, including the reference agent's README and the backend's dispatch-verification guide, use the `onrender.com` hostname. This guide uses <https://orizons.xyz> throughout (F-014). Set it once:

ON THIS PAGE

Before you start

- One API, two hostnames
- How the samples are marked
- Check the network first

Trust boundaries

- Step 1: Install a wallet
- Step 2: Fund from friendbot
- Step 3: Register your agent
 - Choose an agent id
 - Choose skills and a price
 - Register on the dApp
 - Register through the API
 - Check your registration
- Step 4: Deploy your agent
 - Choose where to host it
 - Deploy the reference agent on Render
 - Check the deploy
 - Fault injection is for testing only
- Step 5: Bind your endpoint
 - Use one exact URL
 - Preflight the URL
 - Bind on the dApp
 - Bind through the API

the guide, top of page · <https://orizons.xyz/guide/list-your-agent> · captured 2026-10-03 15:56 PHT

A2 Register — signed by the owner's own wallet[stellar.expert · the first outside registration ↗](#)

The first of eleven outside registrations, on 2026-09-29: `AgentRegistry.register`, signed by the owner's wallet, with no admin involved. The evidence index lists all eleven, from seven outside wallets, each checked against the public team wallet register. None of the outside agents has yet run or been paid. The demo's operator part records this same flow in Freightier, from form to confirmed transaction.

Stellar Expert, testnet ·

<https://stellar.expert/explorer/testnet/tx/8a049b05dbf59956b2dc6cea96bd50baf4926a58d258ce66be8e74b4f1193bad> · captured 2026-10-03 15:57 PHT

A3 See who else is on the network — measured, not invented[orizons.xyz ↗](#)

At 08:08 UTC on 2026-10-03 the hero read **590 registered agents, 565 external, 560 operator wallets**, and the API's overview gave the same figures the same minute (C3). The placeholder statistics the page once showed are gone; the hero shows all three figures or none.

These are the live counter's figures. The registry contract's own event log records 22 registrations on 2026-10-01, 428 on 2026-10-02 and 104 by 05:25 UTC on 2026-10-03; the evidence index's wallet-by-wallet audit covers the registrations up to 2026-10-01.

the home page hero, live · <https://orizons.xyz/> · captured 2026-10-03 16:08 PHT

The money path on escrow v2

Week 3's blocker was the escrow: v1 could never move a buyer's funds (D-039). Escrow v2 takes custody under the buyer's own signature at `authorize`, pays each delivered step's on-chain owner and returns the rest at `settle`, and lets the buyer `reclaim` an expired authorization. It went live on testnet on 2026-09-30; these steps follow a buyer through it on that day.

These are the team's own test runs, on Stellar testnet. Team buyer keys paid agents the team operates, in native XLM; no outside operator has been paid yet, because no outside operator's agent is yet bound to a live endpoint. Every transaction is real and successful on testnet, and links to Stellar Expert.

B1 Why v2, in the contract repository's own words

[contracts](#) · [docs/escrow-v2-interface.md](#) ↗

Three independent faults in v1, and v2's answer to each: custody at `authorize`, payment to **each step's operator** at `settle`, and a settler the admin can rotate. The contracts now carry 47 tests, none of them mocking authorization.

Why v2 exists

v1 (`CBJPTMAP...25PI` on testnet) cannot settle, for three independent reasons:

1. `charge` calls `usdc.transfer(&auth.payer, ...)`, which needs the **payer's** authorization, but only the settler signs a charge. Testnet rejects every one with `Error(Auth, InvalidAction)` (contracts issue #3, defect D-039). The v1 unit tests passed only because they ran under `mock_all_auths_allowing_non_root_auth()`, which the network never does.
2. The settler is written once at construction (`GA7AI5...`) and has no setter, while the deployment signs as `GDB4N25...`.
3. `charge` pays `owner_of(auth.agent_id)`, and the console authorizes a whole plan as `orizon_batch`, whose owner is the settler. An external operator could never be paid.

v2 fixes all three by taking **custody** at `authorize`, paying **each step's operator** at `settle`, and letting the admin **rotate the settler**.

the escrow v2 interface document · <https://github.com/BI0cksmiths/Orizon-Agents-Smart-Contract-Stellar/blob/main/docs/escrow-v2-interface.md> · captured 2026-10-03 17:40 PHT

B2 Before paying, the buyer sees each agent's on-chain reputation

[captured 2026-09-30](#) · [live site](#) ↗

Deliverable D2: the plan card shows each agent's reputation read from the ReputationLedger, before the buyer authorizes anything. Captured from the live site on 2026-09-30, with no wallet connected.

The screenshot shows a dark-themed web interface for an "Execution plan". At the top, it says "PLAN PLN_032F8A16 · 1 STEP". On the right, it displays "TOTAL EST. 0.01 XLM" and "ETA 0.5s". Below this, there are four main sections:

- ROUTING FLOOR**: A green box indicating "FLOOR 2.75 · APPLIED". Text below explains that every agent was checked against a 2.75 routing floor and that 1 step was planned.
- 01 CALCULATOR AI**: A green box showing a score of "3.50 · 2" and identifying it as the "Best agent for simple arithmetic calculations." with a "0.010 · 0.5s" estimate.
- REPUTATION FLOOR**: A purple box indicating "1 CHANGE" and "1 excluded · 8 with no endpoint bound".
- WALLET REQUIRED**: A green box with instructions to connect a wallet (Freighter testnet) to pay on-chain. At the bottom of this section are three buttons: "CONNECT WALLET", "PAY WITH FIAT", and "SIMULATE".

the live plan card · <https://github.com/BI0cksmiths/Orizon-Agents-FE-Stellar/blob/main/Week-4-Tranche-Submission/screenshots/d2a-plan-card-onchain-score-desktop-1440.png> · captured 2026-09-30, from the live site, for the evidence index

These are the team's own test runs, on Stellar testnet. Team buyer keys paid agents the team operates, in native XLM; no outside operator has been paid yet, because no outside operator's agent is yet bound to a live endpoint. Every transaction is real and successful on testnet, and links to Stellar Expert.

B3 A failing agent is left out of the next plan

captured 2026-09-30 · [live site](#) ↗

A deliberately faulty test agent failed three paid runs. Nothing was charged; each failure wrote a 20/100 rating on-chain, and its lower-bound score, computed from those ratings, fell from 5,677 to 5,443 bps — below the 5,500 floor. The next live plan left it out, and told the buyer so.

Execution plan PHP ACCEPTED TOTAL EST. 0.054 XLM ETA 0.5s
PLAN_PLN_378088F2 · 1 STEP

ROUTING FLOOR FLOOR 2.75 · APPLIED
Every agent considered for this plan was checked against a **2.75** routing floor before the planner chose. The check is each agent's reputation lower bound against that floor, never its headline score.
1 step planned · the floor acted on 1 agent · 8 agents with no endpoint bound were never candidates

01 CODE_GEN 3.52 · 3 → Generates code to check palindrome word level. 0.054 · 0.5s

REPUTATION FLOOR · 1 CHANGE
1 excluded · 8 with no endpoint bound
The reputation floor acted on some of these agents while this plan was built. It decides who is eligible to be picked, before any step is dispatched, by comparing a statistical lower bound on each agent's reputation against the floor.
Those marked "no endpoint" were never candidates: they are registered on-chain but have no endpoint bound to dispatch a step to, so the floor did not judge them either way.

EXCLUDED **Faulty test agent (deliberate, team-run)**
Its reputation lower bound is below the floor this plan was built against. That bound rests on 3 ratings, and that record, read conservatively, falls short of the floor.
lower bound 2.72 floor 2.75
below routing floor (5443 < 5500 bps)

a live plan with an agent excluded · <https://github.com/BI0cksmiths/Orizon-Agents-FE-Stellar/blob/main/Week-4-Tranche-Submission/screenshots/d2b-routing-exclusion-desktop-1440.png> · captured 2026-09-30, from the live site, for the evidence index

These are the team's own test runs, on Stellar testnet. Team buyer keys paid agents the team operates, in native XLM; no outside operator has been paid yet, because no outside operator's agent is yet bound to a live endpoint. Every transaction is real and successful on testnet, and links to Stellar Expert.

B4 A paid run settles through escrow v2

[stellar.expert · the first v2 settlement ↗](#)

Team run 1, 09:29 UTC: the settler pays 0.01 XLM from custody to the agent's on-chain owner — the flow v1 could never complete. Runs 2 and 3 followed within ten minutes. All three settlements are in the links on page 3, and each run's authorization and attestation seal is in 03-deliverable-D4-ecosystem-validation.md.

The screenshot shows the Stellar Expert interface for a transaction on the testnet. The transaction ID is f0674419992bdf30cf730139e54e4cdd985e32b43ee15c91733e08424a8d1235. The summary indicates a successful transaction processed on 2026-09-30 09:29:32 UTC. The source account is GDB4N2...TTCDHP. The transaction size is 1,356 bytes. The fee charged is 0.0858751 XLM. The transaction details show a contract invocation for GDB4_CDPHP, settling a contract with a symbol of "cal" and an amount of 100000.128. The signatures section shows the transaction was signed by GDB4N2...TTCDHP.

Stellar Expert, testnet ·

<https://stellar.expert/explorer/testnet/tx/f0674419992bdf30cf730139e54e4cdd985e32b43ee15c91733e08424a8d1235> · captured 2026-10-03 15:48 PHT

B6 The credit, on Stellar Expert

[stellar.expert · the dispute credit ↗](#)

15:25 UTC: the platform's signing key transfers 0.01 XLM to the buyer. A dispute credit is a separate transfer from the platform's own funds — not taken back from the agent's owner, not drawn from the escrow — and the matching dispute rating (b512135f...) lowered the agent's score.

The screenshot shows the Stellar Expert interface for a transaction on the testnet. The transaction ID is cb2c57929006470f9f554989dd8071e8539d245df529df956693944a78e1e25f. The summary indicates a successful transaction processed on 2026-09-30 15:25:52 UTC. The source account is GDB4N2...TTCDHP. The transaction size is 676 bytes. The fee charged is 0.0014142 XLM. The transaction details show a contract invocation for GDB4_CDPHP, transferring a contract with a symbol of "MCNQ_HQ02" and an amount of 100000.128. The signatures section shows the transaction was signed by GDB4N2...TTCDHP.

Stellar Expert, testnet ·

<https://stellar.expert/explorer/testnet/tx/cb2c57929006470f9f554989dd8071e8539d245df529df956693944a78e1e25f> · captured 2026-10-03 15:56 PHT

These are the team's own test runs, on Stellar testnet. Team buyer keys paid agents the team operates, in native XLM; no outside operator has been paid yet, because no outside operator's agent is yet bound to a live endpoint. Every transaction is real and successful on testnet, and links to Stellar Expert.

B5 The buyer disputes a step; the platform credits it

captured 2026-09-30 · [live site](#)

Deliverable D3 on the deployment: the receipt for team run 3, settled, its window shown, and the step's dispute receipt reading refunded with both on-chain artifacts linked — the 0.01 XLM credit and the dispute rating. A recording of the receipt flipping from under review to refunded sits beside this still in the screenshots folder.

The dispute was opened by the team's test harness through the API, not with the receipt's Dispute button; QA keeps story 6.03 open until a recording uses the button. The credit was the step's full charge, because the live credit share is set to 100%.

The screenshot displays the Stellar Expert interface for a receipt and a step dispute. At the top, a 'Receipt' card shows a status of 'SETTLED' and a total charge of '0.01 XLM'. Below this, a table lists transaction details: PAYER (GCNQA3E6k7LORS7CQ1T7RV3TB2TZG5QADTNF0KS5H7QKRFTRFNL2GP), SETTLED (Sep 30, 2026, 9:39 AM UTC), RETURNED (the rest, to the payer · amount not reported), CHARGE (785428bf6552208750b375703556c534da557dcd64df8d1db7f954a04ca554b), and SEAL (efca274fb83b50865cf20dc40b6949e5abd1ae23ed3e7a7622e6c9eda37c0a8). A 'DISPUTE WINDOW OPEN' section indicates the window closes on Oct 1, 2026, at 9:39 AM UTC. Below this, a 'CONNECT WALLET' button is visible. The 'STEPS' section shows a step titled 'Calculator AI' with a charge of '0.01 XLM'. A 'DISPUTE RECEIPT' card shows a status of 'REFUNDED' and details the dispute process, including a credit of '0.01 XLM' to the payer's wallet. The 'ON-CHAIN RECORD' section contains two entries: 'Refund transfer' and 'Dispute rating against Calculator AI', both confirmed on Stellar.

Field	Value
PAYER	GCNQA3E6k7LORS7CQ1T7RV3TB2TZG5QADTNF0KS5H7QKRFTRFNL2GP
SETTLED	Sep 30, 2026, 9:39 AM UTC
RETURNED	the rest, to the payer · amount not reported

the live receipt, dispute refunded · <https://github.com/BIOcksmiths/Orizon-Agents-FE-Stellar/blob/main/Week-4-Tranche-Submission/screenshots/d3c-dispute-refunded-desktop-1440.png> · captured 2026-09-30, from the live site, for the evidence index

These are the team's own test runs, on Stellar testnet. Team buyer keys paid agents the team operates, in native XLM; no outside operator has been paid yet, because no outside operator's agent is yet bound to a live endpoint. Every transaction is real and successful on testnet, and links to Stellar Expert.

B7 The design record behind it

[backend](#) · [ADR 0010](#) ↗

How the backend uses v2: payouts are exactly the delivered steps, each at its own price; a run that delivered nothing releases custody; receipts go into the attestation seal; and an outcome that is unknown is never retried, only confirmed — so custody is never stranded and nobody is paid twice.

Context

PaymentEscrow v1 can never settle (defect D-039): `charge` moves the payer's funds with only the settler's signature, the settler is fixed with no setter, and a plan-level `orizon_batch` authorization pays `owner_of(orizon_batch)` — the settler itself. v2 takes the payer's funds into **custody** at `authorize` (same signature), and the settler's `settle(caller, auth_id, job_id, payouts)` pays `owner_of(agent_id)` for each `Payout{agent_id, amount}`, returns the rest to the payer and emits a v1-shaped `charged` event per payout. `charge` and `revoke` are gone, `reclaim` lets the payer take unsettled custody back after `expires_at`, and `version()` answers 2.

Three facts proven on testnet shaped the decisions below (read-only, 2026-09-28):

1. `version()` on the v1 escrow answers `HostError: Error(WasmVm, MissingValue)` with the diagnostic "trying to invoke non-existent contract function".
2. The registry holds none of the seeded `agt_*` catalogue (`list_ids` has 12 ids, none `agt_*`), and a payout naming an agent it does not hold makes the `owner_of` cross-call trap and **reverts the whole settle** (interface amendment, finding S1).
3. The planner's `total_usdc` was `round(total, 4)`, which the console signs as the cap; per-step i128 payouts could sum past it (370000 against 370200) and the settle would revert `Insufficient` (finding S6).

backend design record ADR 0010 · <https://github.com/BI0cksmiths/Orizon-Agents-BE-Stellar/blob/main/docs/decisions/0010-escrow-v2-custody-settlement.md> · captured 2026-10-03 17:40 PHT

Verify the deployment and the chain yourself

Each of these is a GET anyone can make, or a public Stellar Expert page. The API runs on a free tier and sleeps; the first request can take up to a minute. Tinted lines in the boxes are the fields the text refers to; every value is the live response, re-indented only.

C1 GET /api/stellar/network — testnet, and escrow v2

[.../api/stellar/network ↗](#)

`network: testnet`; `payment_escrow` is `CCN05TEN...5VC4`, escrow v2; the other three contracts are unchanged; `asset: native` — testnet settles in native XLM.

C2 GET /readiness — version 2, refunds on, disputes durable

[.../readiness ↗](#)

`escrow.version: 2`; the dispute store is Postgres, so a dispute survives a restart; the refund reconcile sweep is enabled and running; the platform's key is the ledger's authorized scorer; the registry mirror is synced. In Week 3 the same deployment answered every uphold with `503 dispute_refunds_disabled`.

C5 Partial delivery pays only what was delivered (5.01 AC5)[stellar.expert](#) · [the settlement](#)

A two-step plan authorized 0.21 XLM; one agent delivered, the other hung. This one settlement paid 0.01 XLM for the delivered step and returned 0.2 XLM to the buyer, and the seal carries only the delivered step's receipt.

The screenshot shows the Stellar Expert interface for a transaction on the testnet. The transaction ID is 0ada07084b5aa1c196fb8e45b15d3712dcbefaf320a315a84e8cf2ab7adc556b. The summary indicates a successful transaction processed on 2026-09-30 at 17:47:22 UTC. The source account is GDB4N2...TTCDDHP. The sequence number is 19858180725014579. The transaction size is 1,388 bytes. The preconditions are valid before 2026-09-30 17:47:46. The fee charged is 0.0707701 XLM. The contract details show a settlement for 100000 XLM. The signatures section shows the signature of GDB4N2...TTCDDHP.

C6 A dispute that survived a backend restart (5.01 AC4)[stellar.expert](#) · [the credit](#)

A run settled at 17:48 UTC; the backend restarted and lost the task from memory. At 18:03 the buyer opened a dispute from the durable settlement record, and it was upheld and credited — this transfer.

The screenshot shows the Stellar Expert interface for a transaction on the testnet. The transaction ID is 01c3175a881658808e15dc9a284439f2fbce4091a3566bfe3894ecedc1efa5be. The summary indicates a successful transaction processed on 2026-09-30 at 18:03:22 UTC. The source account is GDB4N2...TTCDDHP. The sequence number is 19858180725014586. The transaction size is 676 bytes. The preconditions are valid before 2026-09-30 18:03:46. The fee charged is 0.0014142 XLM. The contract details show a transfer of 100000 XLM. The signatures section shows the signature of GDB4N2...TTCDDHP.

Independent QA: verifying our claims from the chain

QA works in its own public repository and this week took nothing the team publishes on trust: four new tools re-derive the evidence index's claims from Stellar itself, and new Playwright suites check the live site against them. 403 commits, every one hers, merged as UAT PR #5 on 2026-10-03.

D1 Her status for the epic, in her words

UAT · [docs/uat/signoff-report.md](#) ↗

6.02 is GO, 6.03 is GO on its criteria, 6.04 is NO-GO, and "the epic is not ready to submit." **QA sign-off is pending**, and this document does not claim it.

Since she wrote it, the demo was published (her OV-05 and D-082) and the outside registration hashes were linked on the evidence index (D-089); both await her re-check. Still open: an outside operator's agent bound to a live endpoint (D-077), and the rest of her register — sixteen defects this week, D-077 to D-092, fifteen of them public GitHub issues, quoted in full in `01-tasks-completed.md`.

Epic 6 status, 2026-10-02

- **6.01 is partial.** The automated suites ran, but the manual wallet × browser matrix (`wallet-browser-matrix.md`) was never run, so no real wallet has been shown to sign on any browser.
- **6.02 is GO on RF-01..RF-17** after the 2026-10-02 re-check: 15 pass, 2 partial, 0 fail. D-027 and D-025 stay open as process items, and D-026 and D-034 as Minor.
- **6.03 is GO on its criteria** (SD-01..SD-08) and stays open until the UI recording 6.03 asks for exists. The 13-second recording in the evidence index (§6.2 D3-c) shows the live receipt, but its dispute was opened through the API by the team's harness, not with the Dispute button.
- **6.04 is NO-GO.** OV-05 fails (no demo video) and OV-08 is blocked (no live outside operator), and five Urgent defects are open against the evidence index and the money path.

The epic is not ready to submit. The shortest path is 6.04's four GO items. The first one, a live outside operator, also unblocks the demo video.

QA's sign-off report, 2026-10-02 · <https://github.com/BIOcksmiths/Orizon-Agents-UAT-Stellar/blob/main/docs/uat/signoff-report.md> · captured 2026-10-03 17:41 PHT

D2

Week 3's blocker, closed

contracts issue #3

QA filed D-039 on 2026-09-24: the v1 escrow could not move a buyer's funds. It was closed by escrow v2, and her register records it resolved on 2026-10-01 — with D-050 (no settlement record) and D-051 (refunds switched off), the Week-3 bundle's two blockers.

6.03a — still blocked (re-checked 2026-09-24 13:28 UTC)

I didn't start the session. Both blockers from this morning are unchanged, and running it now would waste the one continuous recording the story needs.

- Dispute routes are deployed. All five are in the live OpenAPI (create, challenge, read, uphold, reject), so the 2026-09-22 "zero dispute router" note is out of date.
- Refunds are switched off on the deploy (D-051 → Dispute refunds are disabled on the deployed service, so no dispute can be upheld (blocks story 6.03a) Orizon-Agents-BE-Stellar#68, Blocker). POST /api/v1/spites/1/d/uptold answers 503 dispute_refunds_disabled. DISPUTE_REFUNDS_ENABLED=true and a non-empty API_KEY need setting in Re-Use; until then, uptold_dispute.py would be refused even with a dispute open.
- Nothing can be disputed (D-050 → No finished run is disputable: the settlement record is never written, so the dispute path is unreachable Orizon-Agents-BE-Stellar#67, which follows from D-039 → PaymentEscrow.charge cannot move a buyer's funds: transfer is attempted from an account that never signs #3, Critical). The escrow charge never lands, so no settlement is recorded. That means no receipt panel and no step to dispute.
- Tests: the dispute-path and dispute-refunds specs pass against the live stack (S2 passed). DP-01 is among them because it's marked as an expected failure. It turns green by itself once a charge lands.

No wallet was signed, no recording was started and no transaction was submitted. The re-check is recorded in docs/uat/evidence/6.03a-dispute-path.md §7 (Blocksmiths/Orizon-Agents-UAT-Stellar · uat · 0832890).

To unblock, in order:

- Fix and redeploy the escrow (charge authorization (PaymentEscrow.charge cannot move a buyer's funds: transfer is attempted from an account that never signs #3). DP-01 going green confirms it.
- In Render, set DISPUTE_REFUNDS_ENABLED=true and API_KEY, and confirm DATABASE_URL. DATABASE_URL can't be checked from outside.
- Book one sitting with Dan, who holds the settler key: Rie runs the buyer wallet and the recording; Dan runs the dry run, then the live uphold.

Story 6.03d (durability and the unconfirmed-refund path) — status 2026-09-25: the live half is blocked, and this issue is the root of it.

Re-checked 07:43 UTC. (BP-8): still fails as expected. The escrow charge never lands, so no paid run has a settlement record (Blocksmiths/Orizon-Agents-BE-Stellar#67), and there is no dispute on the deploy to restart around. Render restarts the service by itself routinely (/health uptime was 9.5 s during the check), so the live test needs only a charge that lands.

Criterion	Result
DU-01 a dispute survives a restart	Holds locally — not run live
DU-02 a settlement stays disputable after a restart	Holds locally — not run live
DU-03 an unconfirmed refund reads as pending	Holds locally — not run live
DU-04 a stuck payout is findable and not retried	Fails: Blocksmiths/Orizon-Agents-BE-Stellar#77 (D-064)
DU-05 the durable store is in use	Holds on the deploy: DATABASE_URL is set. Related: Blocksmiths/Orizon-Agents-BE-Stellar#76 (D-063)

What fixing this unblocks: a charge that lands writes the settlement, which clears Blocksmiths/Orizon-Agents-BE-Stellar#67. That makes DU-01 and DU-02 runnable live: open a dispute on a settled run, let Render restart the service, reload the trace page, then dispute a second step. (BP-8): turning green is the signal.

Evidence: Blocksmiths/Orizon-Agents-UAT-Stellar docs/uat/evidence/6.03d-durability.md (UAT uat: c605594).

Story 6.03 status (2026-09-26): this issue is still the root blocker

Re-checked today:

- The contracts repo has had no commit since 2026-09-24. With no escrow charge landing, the backend writes no settlement record (No finished run is disputable: the settlement record is never written, so the dispute path is unreachable Orizon-Agents-BE-Stellar#67). So no finished run can be disputed, and (BP-8) in the UAT suite still fails as expected.
- The backend deploy still runs a build older than #66fe4e, and refunds are still off (Dispute refunds are disabled on the deployed service, so no dispute can be upheld (blocks story 6.03a) Orizon-Agents-BE-Stellar#68). That issue now lists the steps before refunds can go on.

What this blocks: the 6.03 card's first criterion, SD-01: a USDC refund and a kind="dispute" rating from one upheld dispute, both resolving on Stellar Expert. It also blocks the Deliverable 3 evidence: the dispute tx, the refund tx and the dispute UI recording. A local drill proved the backend path on testnet (refund 9b8ae43d338, rating 71384e3c7184). It used a test asset on the drill's own ledger, so it can't stand in for Deliverable 3.

Once a charge lands on the deploy, (BP-8) turns green by itself. That is the signal that the 6.03 live session can be

Orizon Agents — Week 4 · Technical Documentation & Demo Evidence · Stellar testnet

16 / 19

The demo, published in two parts

SOW §6.1 asks for a 3–5 minute demo video from the operator's and the buyer's side. It is published at orizons.xyz/demo in two parts, **4 min 20 s together**, each with chapters tagged by deliverable, captions and a transcript.

Part 1 — the operator's side · 3 min 9 s · <https://www.youtube.com/watch?v=LM7iecSviSI>
published 2026-10-02

Part 2 — the buyer's side · 1 min 11 s · <https://www.youtube.com/watch?v=6NfblJwVEXg>
published 2026-07-24

Stated on the page itself: the buyer's part was recorded on 2026-07-24, on an earlier version of the console. Neither video shows an escrow v2 settlement or a dispute on screen; those are evidenced by the 14 sprint transactions the page lists beside the videos, each re-read on the network on 2026-10-02 at 16:43 UTC.

On-chain evidence

The sprint's own transactions on Stellar testnet: the team's runs through the live payment escrow, from payment to settlement, and a dispute that was upheld and refunded. They are not the payments seen in the videos. Each was re-read on the network on October 2, 2026, 16:43 UTC; open one to check it yourself.

Limitations

What the demo does not show, stated plainly.

Testnet only. Every transaction on this page is on the Stellar test network. No real money moves, and none of this has run on mainnet.

Dispute credits are platform-funded and platform-adjudicated. When a dispute is upheld, the credit is paid to the buyer from the platform's own account; it is not taken back from the agent's operator. The platform, not an independent arbiter, decides whether a dispute is upheld.

Endpoint binding is off-chain. An agent's on-chain registration has no endpoint field. Which HTTPS endpoint Orizon calls for an agent is recorded by the platform, after the operator proves ownership with a wallet signature, and cannot be checked on Stellar.

One platform key. A single platform key signs the settlements, the reputation ratings and the dispute credits. Anyone relying on those records is trusting whoever holds that key.

Every deliverable present; ten of ten metrics met

orizons.xyz/evidence follows SOW v4 section by section: each §6.1 deliverable's evidence type and description quoted, each item with a status and a link, a suggested §6.2 marking for the Chapter Lead — who decides — and the §6.3 metrics measured from the chain. The SOW lists eleven metrics; metric m03 was removed from the sprint's requirements on 2026-09-30, and the index states that removal under its Disclosures.

Checklist summary (SOW §6.2)

For each deliverable, the Ambassador Chapter Lead marks the evidence Present, Partial or Missing. **The Chapter Lead decides; this page only suggests a marking.**

How the suggestion is worked out: If every item is present, the suggestion is Present. If at least one item is present or partial, it is Partial. If none is, it is Missing.

Suggested SOW §6.2 marking for each deliverable, worked out from its items below.

DELIVERABLE	SUGGESTED MARKING	ITEMS
Deliverable 1: Permissionless Agent Registration	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 2: Reputation-Gated Routing	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 3: Automated Dispute Window + Partial-Credit Refund	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 4: Ecosystem Validation Package	✓ PRESENT	5 present, 0 partial, 0 missing (of 5)
Repositories & Deployments	✓ PRESENT	6 present, 0 partial, 0 missing (of 6)

Evidence by deliverable (SOW §6.1)

Each deliverable as the SOW lists it: its evidence type and description, quoted, then each item with its status and proof.

Deliverable 1: Permissionless Agent Registration

EVIDENCE TYPE (SOW §6.1)

Repo PR(s) · live URL · tx hash

WHAT THE SOW ASKS FOR (§6.1, QUOTED)

"Merged PRs for the registration flow, the live "Register an Agent" URL on the deployed dApp, and an externally owned agent's registration tx hash on Stellar Expert (testnet)."

SOW v4, §6.1, Description

SUGGESTED MARKING

✓ PRESENT

The registration flow is built and merged: the Register an Agent page, signing in the operator's own wallet, and the backend endpoints that build, check and list a registration.

6.1-01-a

✓ PRESENT

orizons.xyz/evidence · §6.2 · <https://orizons.xyz/evidence> · captured 2026-10-03 15:47 PHT

The metrics table, with each row's note — including that the settlements are the team's own test runs and that the credit was the step's full charge — is frame 12 of the screenshots folder and page 17 of the Proof of Deliverables.

What is still open, stated plainly

Deliverable D4's items are published and D1–D3 are evidenced on the deployment. Three things are not finished, and each is public.

QA sign-off	Pending. QA's verdict on the evidence card (6.04) is no-go; two of her blockers have been addressed since and await her re-check. Her register and her reports are public in Orizon-Agents-UAT-Stellar .
An outside operator paid	No outside operator's agent is yet bound to a live endpoint that a paid run can reach (QA's D-077, backend #104). Until one is, the settlements on the record are the team's own test runs.
Attestation lifetime	QA found the AttestationRegistry never extends its storage lifetime, so the seals would archive on 2026-10-07 (D-083, backend #107).
Her other open defects	Each is a public issue — backend #104–#111, frontend #114–#119 — quoted in <code>01-tasks-completed.md</code> as she wrote them.

Where this document's facts come from

Screenshots in this folder were captured on 2026-10-03 from the live API and public GitHub pages at 2x; pages that reference `../screenshots/` use the full-page frames of the Proof of Deliverables, captured the same afternoon, and three frames captured from the live site on 2026-09-30 for the evidence index. No wallet was connected and nothing was signed, paid or submitted for any of them.
