

Orizon Agents — Week 4 Tranche Submission

Proof of Deliverables

Programme	Stellar Instawards (Cohort 2026)
Milestone	M4 · Week 4 — Ecosystem Validation Package (Deliverable D4, Epic 5)
Sprint week	Mon 2026-09-28 → Fri 2026-10-02 (evidence assembled 2026-10-03)
Network	Stellar testnet only
Team	Danielle Bagaforo Meer — lead engineer (GitHub ALGOREX-PH) Rieselle Saure ("Rie") — PM + QA (GitHub rie-hash14)
Evidence captured	2026-10-03 — from the live site, the live testnet API, and public GitHub and Stellar Expert pages; three frames of the live plan card and receipt were captured from the live site on 2026-09-30 for the public evidence index. Every page states its source URL and when it was captured.

DEPLOYED TESTNET CONTRACT IDS

30	Week 3's blocker, closed	Week 3 blocker	p. 34
31	Independent QA's status, in her words	QA · verdict	p. 35

Every page names the public URL it was captured from, so each claim can be checked live. Every frame is of the live deployment or a public page — none is a local run against test fixtures — and every transaction shown is a real, successful Stellar testnet transaction. The settlements and dispute credits are the team's own test runs, in testnet XLM; each page that shows one says so.

What we shipped in Week 4

Week 4 is the week the money path came alive. A new payment escrow was written, deployed to Stellar testnet on 2026-09-30 and switched on — and the same day the live deployment settled paid runs, upheld a dispute and paid the credit, settled a partial delivery, and credited a dispute raised after a backend restart. On top of it, all six stories of **Deliverable D4 — the ecosystem validation package** shipped.

Escrow v2 — the fix for Week 3's blocker

The v1 escrow could never settle a payment between two wallets (defect D-039). Escrow v2 takes custody of the buyer's authorized amount under the buyer's own signature, pays each delivered step's on-chain owner and returns the rest in one transaction, lets a buyer reclaim an expired authorization, and lets the settling key be rotated. 47 contract tests, none mocking authorization.

The six Epic 5 stories, all merged to `main`

- **5.01 — the settlement path on escrow v2**, end to end: contract, backend, console, and a reference agent that can be told to fail, so partial delivery could be proven live.
- **5.02 — adoption metrics and operator onboarding**, computed from the chain with every team wallet excluded through a public register.
- **5.03 — the "List your agent on Orizon" guide**, every sample checked against the live API.
- **5.04 — the demo**, published in two parts, 4 min 20 s, beside the sprint's 14 verified transactions.
- **5.05 — the public evidence index** at orizons.xyz/evidence: every deliverable item present, 10 of 10 metrics met.
- **5.06 — the litepaper**, version 0.5, with §6 rewritten for open registration and escrow v2.

The week in numbers

- **42 pull requests** merged across the five public repositories; 2,718 commits landed on `main`.
- **1,801 authored commits** by the lead engineer in the sprint week, 1,573 of them touching exactly one file; **403 authored commits** of independent QA work, 401 touching one file.
- Backend **4,038 tests** at 94.26% coverage; frontend **2,969 unit** and **446 end-to-end** tests; CI green on `main`. Every repository MIT-licensed.

Where D4 stands, and D1-D3 now live

Every item SOW §6.1 asks of D4 is published and linked, and D1, D2 and D3 now have evidence produced by the deployed service itself.

SOW item	Status
3-5 min demo video, operator + buyer	Published — orizons.xyz/demo , two parts, 4 min 20 s
"List your agent on Orizon" guide	Published — orizons.xyz/guide/list-your-agent , v1.1.0
≥ 2 external registration tx hashes	11, from 7 outside wallets, each on Stellar Expert
≥ 3 settlement tx hashes	3 team runs through escrow v2, plus 2 acceptance runs
Litepaper, §6 updated (§5.1)	Published — orizons.xyz/litepaper , v0.5

D1-D3 on escrow v2

- **D1** — eleven registrations signed by outside operators' own wallets, no admin involved.
- **D2** — the live plan card shows on-chain reputation; a faulty test agent failed three runs, fell below the floor and was left out of the next live plan.
- **D3** — a dispute upheld on the deployment, its credit and its dispute rating on Stellar Expert, and a recording of the live receipt flipping to refunded.

Stated plainly

The settlements and dispute credits are **the team's own test runs** — team keys buying from agents the team operates, in testnet's native XLM — because no outside operator's agent is yet bound to a live endpoint that a paid run can reach. The SOW lists eleven metrics; metric m03 was removed from the sprint's requirements on 2026-09-30, and the evidence index says so. And **independent QA has not signed off**: her verdict on the evidence card is no-go; two of her blockers have been addressed since and await her re-check, and the rest of her register is open and public.

The written bundle sets all of this out with links: [Week-4-Tranche-Submission/03-deliverable-D4-ecosystem-validation.md](#).

How to check any of this without trusting us

Every claim in this document resolves to something public: a merged pull request, a GitHub issue, a transaction on Stellar Expert, a live page or a live endpoint you can call yourself.

Live pages and endpoints

Check	Where
Every deliverable item and metric, linked	orizons.xyz/evidence
The demo and its 14 transactions	orizons.xyz/demo
Network and contract ids, escrow v2	GET orizon-agents-be-stellar.onrender.com/api/stellar/network
Escrow version, refunds, dispute store	GET orizon-agents-be-stellar.onrender.com/readiness
The home page's live figures	GET orizon-agents-be-stellar.onrender.com/api/metrics/overview

The API runs on a free tier and sleeps; the first request can take up to a minute.

Independent QA

QA works in its own public repository, [BL0cksmiths/Orizon-Agents-UAT-Stellar](https://github.com/BL0cksmiths/Orizon-Agents-UAT-Stellar), with tools that re-derive our claims from the chain rather than from our API. This week it logged **16 defects** (D-077 to D-092), 15 as public GitHub issues. Its verdict on the evidence card is **no-go**, and this submission reports it as no-go.

Backend github.com/BL0cksmiths/Orizon-Agents-BE-Stellar · frontend [.../Orizon-Agents-FE-Stellar](https://github.com/BL0cksmiths/Orizon-Agents-FE-Stellar) · contracts [.../Orizon-Agents-Smart-Contract-Stellar](https://github.com/BL0cksmiths/Orizon-Agents-Smart-Contract-Stellar) · reference agent [.../Orizon-Agents-Example-Agent-Stellar](https://github.com/BL0cksmiths/Orizon-Agents-Example-Agent-Stellar) · QA [.../Orizon-Agents-UAT-Stellar](https://github.com/BL0cksmiths/Orizon-Agents-UAT-Stellar).

PaymentEscrow v2 — the contract that fixed the money path

The v1 escrow could never settle a payment between two wallets: its `charge` moved the buyer's funds without the buyer's signature, so the network refused every one (defect D-039). **Escrow v2** takes custody of the buyer's authorized amount at `authorize`, under the buyer's own signature, then pays each delivered step's on-chain owner and returns the rest at `settle` — in one transaction.

It also adds `reclaim` for a buyer whose authorization expired unsettled, and `set_settler` so the settling key can be rotated. The contracts carry 47 tests, none of them mocking authorization, so every signature is checked the way the network checks it.

PaymentEscrow v2: custody at authorize, per-operator settlement, settler rotation (D-039) #4

Merged ALGOREX-PH merged 15 commits into main from feat/escrow-v2 5 days ago

Conversation 0 Commits 15 Checks 0 Files changed 43 +37,215 -505

ALGOREX-PH commented 5 days ago
Collaborator

Fixes #3 (D-039). Part of BLO-35 (5.01), the end-to-end pass across D1-D3.

Why

The deployed PaymentEscrow (v1, `CBJPTMAP_25PI` on testnet) has never settled a workflow, for three independent reasons:

- `charge` moves the payer's funds without the payer's signature. Testnet rejects it every time with `Error(Auth, InvalidAction)`. The v1 tests passed only because they ran under `mock_all_auths_allowing_non_root_auth()`, which the network never does.
- The settler was fixed at construction (`G67A15...`) with no setter, while the deployment signs as `GDB4N25...`.
- `charge` pays `owner_of(auth.agent_id)`, and the console authorizes whole plans as `orizon_batch`. An external operator could never be paid.

What v2 does

The frozen interface is in [docs/escrow-v2-interface.md](#).

- `authorize`: same signature as v1. It now takes custody of `max_amount`, covered by the payer's one signature. The label is the plan id.
- `settle(settler, auth_id, job_id, payouts[])`:
 - Pays each step's operator (`owner_of` per payout) and returns the remainder to the payer, in one transaction.
 - Writes its state before any transfer.
 - An empty `payouts` is a full release.
 - It is allowed after `expires_at` until the payer reclaims, so a long run still pays the operators it used.
 - A payout to an agent that isn't registered reverts the whole settle.
- `reclaim`: the payer only, and only after expiry. After expiry, whichever of `settle` and `reclaim` lands first wins.
- `set_settler`: admin rotation. This also makes the Litepaper \$6.1 claim true.
- `version() = 2`. `charge` and `revoke` are removed.
- Events**: `charged` keeps its v1 shape, so existing earnings decoders work. Its topic is now the agent actually paid. `settled` and `reclaimd` are new.
- Storage**: persistent entries are extended to the remaining window plus 30 days on every read and write.

Tests

- 32 escrow tests, none using `mock_all_auths*`**. Money paths use explicit `mock_auths` trees and assert `env.auths()`, including the payer's nested SAC transfer inside `authorize`.
- Real contracts**: a real Stellar Asset Contract, and the real `AgentRegistry` with two different owners. Every balance is asserted.
- Coverage**: every error code, the 16/17 payout boundary, overflow, replay, the settle and reclaim race after expiry, settler rotation, event shapes and TTL.
- Teeth-checked**: removing any auth guard, or any expiry/lock rule, fails tests.

Escrow v2 recorded as deployed on testnet

The contracts repository's address book now names escrow v2, CCN05TEN...5VC4, with its settler and admin; the v1 id is kept as history. The deploy script read back `version = 2`, the settler and the admin before the record was written.

The frontend pins the same id and checks it against this address book in CI, so the app and the contracts cannot silently disagree about which escrow is live.

Source <https://github.com/BI0cksmiths/Orizon-Agents-Smart-Contract-Stellar/pull/6>
Captured 2026-10-03 15:53 PHT · screenshots/02-contracts-pr-6-escrow-v2-deployed.png

The screenshot shows a GitHub pull request interface. At the top, the repository is 'BI0cksmiths / Orizon-Agents-Smart-Contract-Stellar'. The pull request title is 'Record the testnet escrow v2 deployment #6', which has been merged. The merge was performed by 'ALGOREX-PH' 3 days ago. The pull request details show 1 commit, 0 checks, and 1 file changed. A comment from 'ALGOREX-PH' (a collaborator) explains that escrow v2 is deployed on testnet from the admin key, with the backend's signing key as the settler, approved by the Chapter Lead on 2026-09-30. The comment includes a bulleted list of details: payment_escrow_v2 (CCN05TENCK3EK532I30ZLZ63323FEEULPAKJ74CUP3JZK3XQINRQ5VC4), settler (GDB4N25UYM3YNTTAWX7LSG12P7OR62QZQXRQWAG5TFVENDKCTTCDHP), and admin (GA7AI5TAJEZA27I666D5JC4MUJYBEWUYNZWPUR2ONA7IZQV06R5QQV). It also states that the deployment was done using 'make deploy-escrow-v2', the script read back 'version = 2', and that v1's payment_escrow remains valid as history. The pull request history shows a commit 'b982e2e' recorded the testnet escrow v2 id, settler and admin, which was then merged by 'ALGOREX-PH' into the main branch. On the right, the 'Reviewers' section shows 'No reviews', 'Assignees' shows 'No one assigned', 'Labels' shows 'None yet', 'Projects' shows 'None yet', and 'Milestone' shows 'No milestone'. The 'Development' section notes that successfully merging this pull request may close these issues. At the bottom, a yellow banner encourages signing up for free to join the conversation on GitHub.

Record the testnet escrow v2 deployment #6

Merged ALGOREX-PH merged 1 commit into main from chore/deploy-escrow-v2 3 days ago

Conversation 0 Commits 1 Checks 0 Files changed 1 +4 -1

ALGOREX-PH commented 3 days ago Collaborator

Escrow v2 is deployed on testnet from the admin key, with the backend's signing key as settler, approved by the Chapter Lead on 2026-09-30.

- payment_escrow_v2 : CCN05TENCK3EK532I30ZLZ63323FEEULPAKJ74CUP3JZK3XQINRQ5VC4
- settler: GDB4N25UYM3YNTTAWX7LSG12P7OR62QZQXRQWAG5TFVENDKCTTCDHP (the backend's ratings.signer)
- admin: GA7AI5TAJEZA27I666D5JC4MUJYBEWUYNZWPUR2ONA7IZQV06R5QQV

Deployed with make deploy-escrow-v2 ; the script read back version = 2, settler and admin and matched all three before writing the address book. v1's payment_escrow stays as history and remains valid, so rolling back is pointing the backend at it again.

recorded the testnet escrow v2 id, settler and admin b982e2e

Every paid run settles through escrow v2

Each run now ends in one `settle` that pays only the steps that delivered and releases custody on every path that does not settle. Only a confirmed transaction counts, and each run reports its settlement state — settled, released, skipped, unconfirmed or failed — rather than a bare success flag.

An authorization is bound to the caller and the plan it was signed for, so one signature buys one task. A testnet lifecycle harness drives whole runs and writes every transaction it sees, read back from the network, into the evidence files this bundle cites.

5.01: settle through escrow v2, bind authorizations to plans, fresh reputation, lifecycle harness #88

Merged ALGOREX-PH merged 115 commits into main from feat/5.01-integration 5 days ago

Conversation 0 Commits 115 Checks 1 Files changed 65 +11,842 -158

**ALGOREX-PH** commented 5 days ago Collaborator

BLO-35 (5.01): the backend half of the end-to-end pass across D1-D3. It pairs with the contracts PR [BI0cksmiths/Orizon-Agents-Smart-Contract-Stellar#4](#) (PaymentEscrow v2) and the frontend and reference-agent PRs.

Why

No workflow has ever settled on the deployed escrow (D-039, contracts [#3](#), backend [#67](#)), so none of 5.01's acceptance criteria could pass. Escrow v2 fixes the contract. This PR makes the backend settle through it, and fixes the seams a code-and-live audit of every criterion found.

What changes

Settlement through escrow v2 (ADR 0010)

- Escrow version** is detected from `version()` and cached per contract id. An unreadable version is never guessed as v2.
- One settle per run.** It pays each **delivered** step's operator its own price, so a timed-out step is never paid (ACS), and returns the remainder to the buyer.
 - Receipts are decoded as a vector, and all of them reach the seal. The seal total is the sum of payouts.
 - Payouts are held under the authorization's own `max_amount`.
 - The plan total is now exact to the stroop, so the signed cap always covers the payouts (S6).
- Seeded `agt_*` agents are not on-chain**, and a payout to one would revert the whole settle (S1). Their delivered steps are recorded `unpaid_reason: "no_onchain_owner"`, and the buyer keeps that share.
- Custody is never stranded (S4).** `release_authorization` (an empty settle) runs on every non-settling path: zero delivered, a cancelled or crashed run, a refused settle, and the router's own refusals.
- An unconfirmed settle is never retried.**
- Only confirmed transactions count as evidence (S7)**, for both v1 and v2. A new `SettlementState` (`settled` | `released` | `skipped` | `unconfirmed` | `failed`) appears on the task, the trace and the receipt.
- Per-step receipt fields:** `paid_usdc`, `receipt_id_hex` and `unpaid_reason`. They live inside the existing JSONB `steps` column, so there is no ALTER.
- Earnings:** `settlement_svc` decodes v2 `charged` events per paid agent, and keeps the self-payment exclusions honest.
- The v1 `charge` path is unchanged**, except for S7.

The authorization is bound to its plan (S2; ADR 0011)

Before this, anyone could run their own plan against someone else's authorization. Now:

- At execute** (v2 only, before any task is minted), the authorization must be the caller's, labelled with this plan id, unspent, big enough for the plan, and alive for a worst-case run (902.5 s for six steps). Any mismatch is refused with a coded error.
- One authorization, one task.** A per-authorization lock and claim refuse a second execute with 409 `authorization_used`.
- Paid runs** read the escrow version first and answer 503 rather than run unchecked. A late settle that finds the authorization is not this payer's for this plan neither spends it nor releases it.
- POST `/api/stellar/build/reclaim`** builds the payer's `reclaim` transaction after expiry, with coded pre-checks.

The console says what the signature does

The Authorize step tells the buyer that the plan's maximum moves into escrow and the unused part comes back at settlement, checks their balance first, and shows the cap exactly. The receipt shows the settlement state and each step's payout with its Stellar Expert link, and offers Reclaim once an authorization has expired.

5.01: custody-honest authorize, per-step payouts, reclaim, and the escrow v2 switch #89

Merged ALGOREX-PH merged 85 commits into main from feat/5.01-escrow-v2-ui 5 days ago

Conversation 1 Commits 85 Checks 4 Files changed 59 +5,303 -204

**ALGOREX-PH** commented 5 days ago Collaborator

BLO-35 (5.01): the frontend half of the end-to-end pass across D1-D3. It pairs with [BIOcksmiths/Orizon-Agents-Smart-Contract-Stellar#4](#) (PaymentEscrow v2), [BIOcksmiths/Orizon-Agents-BE-Stellar#88](#) and [BIOcksmiths/Orizon-Agents-Example-Agent-Stellar#6](#).

Merge this with the escrow switch, not before it. Its custody wording ("moves up to X into escrow now") is true only against escrow v2. The steps are in `docs/escrow-v2-switch.md`: deploy v2, flip `STELLAR_PAYMENT_ESCROW` in Render, set the testnet pin in `lib/escrow-address.json`, then merge.

Authorize, under custody

- **Every sentence around Authorize now tells the truth under v2:** signing moves the plan's maximum into escrow now, delivered steps are paid from it, and the rest comes back when the run settles. The pipeline diagram, the events empty state and the operator panel name `settle` rather than `charge`.
- **The authorization label is the plan id (S2).** The backend refuses to execute a plan against an authorization made for another plan.
- **`AUTHORIZE_TTL_SECONDS = 1800`**, one named constant (S3).
- **The cap is shown exactly as signed**, to the stroop (S6).
- **Insufficient balance:** a pre-check (cap, fee headroom and base reserve) runs before anything is built, and the chain's own refusal maps to the same typed error.
- **Execute refusals:** every `authorization_*` code, `plan_expired`, `not_found` and `capacity_exhausted` get plain copy.
 - A `release_tx_hash` shows "your funds were returned" with a link.
 - A confirmed authorization stays shown, and Authorize is disabled so a second cap can't be locked.

Receipt and trace

- **Settlement state:** `settled` / `custody released` / `nothing charged` / `unconfirmed` / `failed`. Only `settled` shows a charged total. The state is announced in a polite live region.
- **Per-step payouts**, each with a Stellar Expert link.
 - A seeded platform agent reads "delivered · not billed (platform agent)".
 - An unconfirmed payout is not disputable.
- **Evidence:** charge and seal hashes appear as "On-chain receipts" only when the settlement is `settled` (S7). Failed hashes are never shown as evidence.
- **Reclaim** is built against `POST /api/stellar/build/reclaim`. It's offered only to the paying wallet after `expires_at`, and every refusal code has its own wording.

Honest after a rating

- **Agents page (S10):** it re-reads when the tab regains focus after 5 s, and has an "updated" time and a Refresh button.
- **Floor notices** with `awaiting_fresh_read` (S8) read "held off until a fresh reputation read answers", never "below the floor" for a bound that is above it.

Escrow address switch

`lib/escrow-address.json` holds the v2 pin, currently `null`, never a guessed id. It is checked:

Orizon Agents — Week 4 Tranche Submission · Proof of Deliverables · Stellar testnet

8 / 35

The guide, the demo page, the evidence index and the litepaper

The public face of Deliverable D4 in one integration PR: the **List your agent on Orizon** guide with every sample checked against the live API's schema, the demo page, the public evidence index with build-time validation and a live link checker, the litepaper published in four formats, and the MIT licence.

It is large because it consolidates six story lanes and imports the litepaper with its own history; the per-PR figures and why are in the written bundle.

Epic 5: operator guide, demo, evidence index, litepaper, MIT licence and audit fixes #97

Merged ALGOREX-PH merged 679 commits into main from fix/5-audit-fe-integration 4 days ago

Conversation 1 Commits 679 Checks 4 Files changed 296 +60,448 -542

ALGOREX-PH commented 4 days ago • edited • Collaborator

Epic 5 (Week 4) for the frontend, as one PR: stories 5.03 to 5.06, the MIT licence, and the fixes from the Epic 5 audit. It replaces [#91](#), [#92](#), [#93](#), [#94](#), [#95](#) and [#96](#), which are closed; every one of their commits is here unchanged, and each write-up follows as one part.

Merge this one first, with a merge commit (not squash). Production's plan card tells buyers that authorizing moves funds into escrow while the live escrow is v1, which takes no custody; part 6 fixes that. Merge commits keep every story's commits with the ids that the evidence index and the litepaper cite.

The backend half is [BIOcksmiths/Orizon-Agents-BE-Stellar#94](#). The deploy order is in its `docs/operators/epic5-deploy-runbook.md`.

Gate for the whole branch

- typecheck, lint and format:check: clean.
- test:coverage: 2,660 vitest tests and 28 node tests pass.
- build and bundle: pass; every route is inside the 480 KB first-load budget.
- test:parity: 128 pass, 0 fail, 1 skipped (the guide's Python signing snippet, which needs `ORIZON_BE_VENV`; it passes 78 of 78 with it set). The guide check, the evidence check and the demo check pass.
- Playwright + axe: 302 passed, 3 skipped, 0 failed. The 3 skipped are the v2-only specs, which run once the escrow v2 pin is set.
- The live evidence verifier passed 125 of 125 links on the evidence lane.

Every new test was teeth-checked: the code or content it guards was broken on purpose and the test failed.

Part 1: 5.03: the public 'List your agent on Orizon' guide, with every sample verified (was [#91](#))

BLO-37 (5.03): the public "List your agent on Orizon" integration guide, named as evidence in SOW §6.1 and §8.

The guide: `/guide/List-your-agent`

The source is `content/guides/list-your-agent.md`, **written from the operator friction log, not from memory**, and every API fact is taken from backend source at [16819ef](#).

- **The full path:** wallet → friendbot → register → deploy the reference agent → bind → readiness → get routed → get paid → reputation.
- **The three 1.03 error codes** (`id_malformed`, `id_reserved`, `id_taken`), each with its meaning and what to do.
- **Reputation as an operator sees it:** you start at the prior, you are routable at once, ratings come from delivered work, and disputes cost you routing.
- **An honest dispute section.**
- **A Trust boundaries section near the top:**
 - endpoint binding is off-chain;
 - one platform key is the settler, scorer and sealer on testnet;
 - the platform decides disputes and funds every credit;
 - testnet settles in native XLM while the copy says USDC;

Orizon Agents — Week 4 Tranche Submission · Proof of Deliverables · Stellar testnet

9 / 35

A reference agent that can be told to fail

Opt-in, off by default: `FAULT_MODE` makes the copyable reference agent hang, answer slowly or return errors after a set number of dispatches, so the failure paths — no payment for undelivered work, partial delivery, the reputation consequence — can be proven on testnet. It refuses to start in fault mode on any network but testnet, and announces itself when active. 85 tests; 23 deliberate mutations all caught.

Opt-in fault injection for integration testing (5.01 AC5) #6

Merged ALGOREX-PH merged 11 commits into main from feat/5.01-fault-mode 5 days ago

Conversation 0 Commits 11 Checks 0 Files changed 4 +776 -9

**ALGOREX-PH** commented 5 days ago Contributor

BLO-35 (5.01), acceptance criterion AC5: "an external agent that stops responding partway through a workflow... the buyer should be charged only for delivered steps and the workflow should still seal."

To run that on the deployed stack, an operator's agent has to stop responding on demand. This adds an **opt-in, off-by-default** fault mode for integration testing only.

Environment variables

- `FAULT_MODE` takes one of three values:
 - `hang_after:N`: holds each dispatch after the Nth for the signed deadline plus 15 s, then closes without answering. The backend records `response_timeout`, never retries it, and never bills it.
 - `delay_ms:M`: answers correctly after M ms.
 - `error_after:N`: answers 503 after N dispatches. The backend records `error_status`, with no retry and no charge.
- `FAULT_SCOPE`: `process` (the default) or `intent`, which counts per workflow.

Safety rails

- Refuses to start** (exit 2) on any invalid value, naming the variable. It also refuses without a pinned `ORIZON_SIGNER`, or on any network but testnet.
- Only genuine dispatches count**. The counter advances only after the signature, envelope and replay checks pass, so unauthenticated traffic can never trigger a fault.
- The counter is lock-protected**, the hold is bounded, and the keyed counters are capped.
- An active mode is loud**: a startup `WARNING`, a `WARNING` on every faulted dispatch, an `X-Fault-Injection` header, and a `fault_injection` field on `GET /`. With the mode off, the header and field are absent.
- The README** warns never to enable it for real work, gives the three recipes and teardown steps, and explains how to run a second agent from a second wallet.

Tests

- 85 pass** (37 existing, 2 new golden tests of the unchanged default behaviour, 46 new fault tests).
- The new tests cover concurrency, real-socket hang, 503 and delay behaviour, forged or unsigned or replayed requests never counting, and startup refusals in a subprocess.
- 23 deliberate mutations**, every one caught.

The repo has no CI config. The gate was `pytest` and `ruff check` (clean). The remaining `ruff format` differences are on untouched lines that were already on `main`.

For the evidence run

The deterministic AC5 setup is two external agents, with the second on `hang_after:0`: step 1 delivers, and step 2 times out about 100 s after it is sent.

ALGOREX-PH added 11 commits 5 days ago

 pinned the normal dispatch and health responses as a golden 343db92

The home page shows measured figures only

590 registered agents, 565 external agents, 560 operator wallets, read from the Stellar testnet registry. The placeholder statistics the page used to show are gone: every figure now comes from a source that can be checked, and the hero shows all three or none, never a partial count while the registry mirror refills.

These are the live counter's figures. The registry contract's own event log records 22 registrations on 2026-10-01, 428 on 2026-10-02 and 104 by 05:25 UTC on 2026-10-03; the evidence index's wallet-by-wallet audit covers the registrations up to 2026-10-01.

Source <https://orizons.xyz/>

Captured 2026-10-03 16:08 PHT · screenshots/10-orizons-home-live-stats.png

The same figures from the API, read the same minute

The response behind the hero: `registered 590`, `external 565`, `external_wallets 560`, and five workflows settled on 2026-09-30. Anything the service cannot read is returned as `null` with `degraded: true` rather than guessed.

The public evidence index: every deliverable present

The index follows the SOW section by section and suggests a §6.2 marking for each deliverable from its items: D1 3 of 3, D2 3 of 3, D3 3 of 3, D4 5 of 5, Repositories & Deployments 6 of 6 — all **Present**. The Chapter Lead decides; the page only suggests.

Source <https://orizons.xyz/evidence>

Captured 2026-10-03 15:47 PHT · screenshots/11-orizons-evidence-checklist.png

Checklist summary (SOW §6.2)

For each deliverable, the Ambassador Chapter Lead marks the evidence Present, Partial or Missing. **The Chapter Lead decides; this page only suggests a marking.**

How the suggestion is worked out: If every item is present, the suggestion is Present. If at least one item is present or partial, it is Partial. If none is, it is Missing.

Suggested SOW §6.2 marking for each deliverable, worked out from its items below.

DELIVERABLE	SUGGESTED MARKING	ITEMS
Deliverable 1: Permissionless Agent Registration	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 2: Reputation-Gated Routing	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 3: Automated Dispute Window + Partial-Credit Refund	✓ PRESENT	3 present, 0 partial, 0 missing (of 3)
Deliverable 4: Ecosystem Validation Package	✓ PRESENT	5 present, 0 partial, 0 missing (of 5)
Repositories & Deployments	✓ PRESENT	6 present, 0 partial, 0 missing (of 6)

Evidence by deliverable (SOW §6.1)

Each deliverable as the SOW lists it: its evidence type and description, quoted, then each item with its status and proof.

Deliverable 1: Permissionless Agent Registration

EVIDENCE TYPE (SOW §6.1)

Repo PR(s) · live URL · tx hash

WHAT THE SOW ASKS FOR (§6.1, QUOTED)

"Merged PRs for the registration flow, the live "Register an Agent" URL on the deployed dApp, and an externally owned agent's registration tx hash on Stellar Expert (testnet)."

SOW v4, §6.1, Description

SUGGESTED MARKING

✓ PRESENT

The registration flow is built and merged: the Register an Agent page, signing in the operator's own wallet, and the backend endpoints that build, check and list a registration.

6.1-D1-a

✓ PRESENT

Ten of ten success metrics met

Measured from the chain by a read-only generator. The SOW lists eleven metrics; metric m03 was removed from the sprint's requirements on 2026-09-30, and the index states that removal under its Disclosures. Each row's note says what it rests on — including that the three settlements are the team's own test runs and that the credit was the step's full charge.

To fit the ten rows on one page, the "How measured" notes and the Proof column were hidden in the browser for this capture; both are on the live page.

Source <https://orizons.xyz/evidence>

Captured 2026-10-03 15:49 PHT · screenshots/12-orizons-evidence-metrics.png

https://orizons.xyz/evidence — the "How measured" notes and the Proof column are hidden here so all ten rows fit one frame; both are on the live page.

Success metrics (SOW §6.3)

10 of 10 metrics met.

Each target is the SOW's own. Where a target was missed, the reason is given in its row.

SOW §6.3 success metrics: 10 of 10 metrics met. Target, achieved value, status and proof for each.

METRIC	TARGET	ACHIEVED	STATUS
ADOPTION TARGETS Externally-operated agents registered on Testnet	≥ 2	11	✓ MET
ADOPTION TARGETS Unique external operator wallet addresses	≥ 2	7	✓ MET
TRANSACTION TARGETS On-chain USDC settlements (charges) recorded	≥ 3	3	✓ MET
TRANSACTION TARGETS Dispute → partial-refund settlements	≥ 1	1	✓ MET
TECHNICAL MILESTONES Permissionless AgentRegistry/register flow live on the dApp	Yes	Yes: the Register page is live and open to any wallet. Seven outside wallets have registered agents (see metric 2).	✓ MET
TECHNICAL MILESTONES Reputation-gated routing (reads avg_bps, applies a floor) live	Yes	Yes: the planner reads each agent's on-chain reputation and applies a floor of 2.75 out of 5. On 2026-09-30 a live plan left out the team's deliberate faulty test agent, whose lower bound had fallen below the floor (see Deliverable 2).	✓ MET

The demo's 14 verified sprint transactions

Neither video shows an escrow v2 settlement or a dispute on screen, so the page lists the sprint's own transactions beside them: three escrow v2 runs, each an authorization, a rating, a settlement and a seal, plus the dispute credit and the dispute rating — each re-read on the network on 2026-10-02 at 16:43 UTC. The Limitations below it state the rest plainly.

Source <https://orizons.xyz/demo>

Captured 2026-10-03 15:47 PHT · screenshots/14-orizons-demo-transactions.png

On-chain evidence

The sprint's own transactions on Stellar testnet: the team's runs through the live payment escrow, from payment to settlement, and a dispute that was upheld and refunded. They are not the payments seen in the videos. Each was re-read on the network on October 2, 2026, 16:43 UTC; open one to check it yourself.

Limitations

What the demo does not show, stated plainly.

Testnet only. Every transaction on this page is on the Stellar test network. No real money moves, and none of this has run on mainnet.

Dispute credits are platform-funded and platform-adjudicated. When a dispute is upheld, the credit is paid to the buyer from the platform's own account; it is not taken back from the agent's operator. The platform, not an independent arbiter, decides whether a dispute is upheld.

Endpoint binding is off-chain. An agent's on-chain registration has no endpoint field. Which HTTPS endpoint Orizon calls for an agent is recorded by the platform, after the operator proves ownership with a wallet signature, and cannot be checked on Stellar.

One platform key. A single platform key signs the settlements, the reputation ratings and the dispute credits. Anyone relying on those records is trusting whoever holds that key.

Transcript

List your agent on Orizon

From nothing to a routed, paid agent on testnet: wallet, friendbot, register, deploy, bind, readiness, reputation. Version 1.1.0, verified against the backend that runs escrow v2. It is labelled a draft until someone new to Orizon has followed it end to end.

READING THE CODE BLOCKS

Runs live

Runs as written against the public testnet backend. Nothing of yours is needed.

Runs offline

Runs on your own machine without calling Orizon, for example to build or check a signature.

Needs your key

Needs something only you have, such as your secret key, account or endpoint, filled in before it runs.

Expected response

What the sample above it prints when it works. Your ids and times will differ.

Each block has a Copy button and a # link you can share.

This guide takes you from nothing to an agent that Orizon's orchestrator routes work to, on Stellar **testnet**. The path is nine steps, and each one says what you should see and what to do if it goes wrong:

install a wallet → fund it from friendbot → register an agent → deploy your agent → bind an endpoint → check readiness → get routed → get paid → check your reputation

It was written from the operator friction log (backend `docs/operators/friction-log.md`, entries F-001 to F-035), not from memory. Wherever a newcomer got stuck, the step says so, and the [Friction log coverage](#) appendix maps every entry to the place that answers it. Story 1.07's own friction log for the first external registration was never filled in. The backend repository only ever held its blank template, added in commit `7f77a13` and removed from `main` since; every branch that still has the file has that same blank copy. The registration friction here therefore comes from the UAT team's registration QA (story 6.01) and the 5.02 onboarding log, which carries those findings forward.

NOTE

The fastest path is the reference agent (story 2.04): <https://github.com/B10cksmiths/Orizon-Agents-Example-Agent-Stellar>. It is one Python file that already verifies the dispatch signature, checks the envelope and answers in the right shape, with a Reader Blueprint to deploy it. This guide deploys it in **Step 4**. You can

LITEPAPER

The Orizon Agents Protocol Litepaper

VERSION

0.5

DATED

September 30, 2026

BY

The Blocksmiths

The litepaper is the builder's introduction to Orizon Agents, a protocol for pay-per-workflow agent commerce on Stellar: AI agents find each other in an open registry, are paid per step through an on-chain escrow, and have each job sealed on chain. It explains why the protocol exists, how the working implementation behaves today, who runs what and who can change what, and what is designed but not yet shipped. Its claims about shipped behaviour cite the source code they rest on, and the deployment it describes is on Stellar testnet.

Read or download it

Four copies of the same book. No account or wallet is needed.

[PDF document \(PDF, 2.5 MB\)](#)

For reading offline and printing.

[Web page \(HTML, 3.4 MB\)](#)

The whole book on one page, with its diagrams drawn in your browser.

[Word document \(DOCX, 1.1 MB\)](#)

For Word, Google Docs or LibreOffice.

[Markdown text \(MD, 173 KB\)](#)

The bound book as plain text, the form it is written in.

[Go straight to §6 · Operations and Governance, in the web page \(HTML, 3.4 MB\)](#) — the chapter this version updates.

What changed in v0.5

Version 0.5 updates §6, Operations and Governance, for open registration: anyone can now list an agent. Each change below names the subsection it is in, and says whether it is new or puts right a claim from the last version.

Open registration NEW · §6.2, §6.3

Registration is permissionless and live. Any wallet registers an agent on chain with only its own signature, and no Blocksmiths approval is needed. The owner then binds an HTTPS endpoint off chain by signing a challenge with the same wallet. The twelve genesis agents are now a seed set inside the open registry, not the registry itself.

The live API is on testnet, with escrow v2

`network: testnet`, and `payment_escrow` is now CCN05TEN...5VC4, escrow v2. The other three contracts are unchanged. `asset: native`: testnet settles in native XLM.

The first settlement through escrow v2

The platform's settler pays 0.01 XLM from custody to the agent's on-chain owner — the flow v1 could never complete. One of three settlements D4 asks for; the other two are linked in the written bundle, each with its authorization and attestation seal.

A team test run: a team buyer key paid an agent the team operates. No outside operator has been paid yet.

D2 live: on-chain reputation on the plan card

Before the buyer pays, the plan card shows each agent's reputation read from the ReputationLedger. Captured from the live site on 2026-09-30 for the public evidence index, with no wallet connected.

Source	https://github.com/BIOcksmiths/Orizon-Agents-FE-Stellar/blob/main/Week-4-Tranche-Submission/screenshots/d2a-plan-card-onchain-score-desktop-1440.png

D2 live: a sub-floor agent left out of the plan

A deliberately faulty test agent failed three paid runs on 2026-09-30; nothing was charged, and each failure wrote a 20/100 rating on-chain. Its lower-bound score, computed from those ratings, fell from 5,677 to 5,443 bps, below the 5,500 floor, and the next live plan left it out — saying so to the buyer.

0.054 · 0.5s

REPUTATION FLOOR · 1 CHANGE

1 excluded · 8 with no endpoint bound

The reputation floor acted on some of these agents while this plan was built. It decides who is eligible to be picked, before any step is dispatched, by comparing a statistical lower bound on each agent's reputation against the floor.

Those marked "no endpoint" were never candidates: they are registered on-chain but have no endpoint bound to dispatch a step to, so the floor did not judge them either way.

EXCLUDED

Faulty test agent (deliberate, team-run)

Its reputation lower bound is below the floor this plan was built against. That bound rests on 3 ratings, and that record, read conservatively, falls short of the floor.

lower bound 2.72 floor 2.75

below routing floor (5443 < 5500 bps)

D3 live: the dispute credit

The platform upheld a dispute on team run 3 and its signing key paid the buyer 0.01 XLM — the step's full charge, because the live credit share is set to 100%. A dispute credit is a separate transfer from the platform's own funds, not taken back from the agent's owner.

D3 live: the dispute rating

The matching `kind="dispute"` rating on the ReputationLedger, which lowered the agent's score — the consequence that feeds the routing floor in D2. Together with the credit, the dispute transaction and its partial-refund transaction D3 asks for.

D3 live: the buyer's receipt, refunded

The live receipt for team run 3: settled, the dispute window, and the step's dispute receipt reading refunded, with the credit and the dispute rating each linked to Stellar Expert. A recording of the same receipt flipping from under review to refunded is beside this still in the folder.

The dispute was opened by the team's test harness through the API, not with the receipt's Dispute button; QA keeps story 6.03 open until a recording uses the button.

VIEW RATING ON STELLAR.EXPERT

Partial delivery: only the delivered step is paid

A two-step plan authorized 0.21 XLM. One agent delivered; the other hung. This one settlement paid 0.01 XLM for the delivered step and returned 0.2 XLM to the buyer, and the seal carries only the delivered step's receipt — per-operator settlement, including the case where an operator fails.

A dispute that survived a backend restart

A run settled at 17:48; the backend was restarted and the task was gone from its memory. At 18:03 the buyer opened a dispute from the durable settlement record, and it was upheld and credited — this transfer. A buyer's 24-hour window does not end at the next restart, which a free-tier host performs whenever it idles.

An outside operator's registration

`AgentRegistry.register` signed by the owner's own wallet, with no admin involved — the first of eleven outside registrations from seven wallets on 2026-09-29 and 2026-09-30 that the evidence index lists and links, two more than D4's minimum. None of the outside agents has yet run or been paid.

Week 3's blocker, closed

QA filed it on 2026-09-24: the v1 escrow's `charge` could not move a buyer's funds. It was closed by escrow v2 (contracts #4), and QA's register records it resolved on 2026-10-01, together with the other Week-3 blocker, refunds switched off on the deployment.

PaymentEscrow.charge cannot move a buyer's funds: transfer is attempted from an account that never signs #3

New issue

Closed

#4

rie-hash14 opened 1w ago

Severity: Critical

What happens

authorize records an Authorization, takes no custody and grants no allowance. charge is settler-gated (caller.require_auth()) and ends in usdc.transfer(auth.payer, &agent_owner, &amount). The SAC's transfer requires from.require_auth() — the payer's authorization — but the charge transaction is signed by the settler alone, so the host rejects it with Error(Auth, InvalidAction) .

Evidence from two QA runs against testnet

Contract CBJPTMAPMGODGZCZ2IMEQSRUX3WGUXNMKDTNN2KMU3NFGYZ5OJ5525PI :

2026-09-17: 9 authorizations, 0 charged events.

2026-09-24 (after the backend redeploy; contract unchanged): 7 more authorizations, 0 charged events. The payer's balance moved only by transaction fees.

Every run still finalizes as complete with a spent figure and charge_tx: null , and the buyer's trace carries a single error on-chain settlement failed line.

Impact

No operator has ever been paid through the escrow. The escrow's existing successful charges are the settler paying itself, which cannot stand in for a buyer paying an operator. It also makes the whole Epic 4 dispute and refund path unreachable, since a settlement record is only written when a charge lands (filed separately against the backend).

Suggested fix

Take custody of the payer's asset at authorize time, or have charge use transfer_from against an allowance the payer granted, or have the payer co-sign the charge. The deployed ABI has no approve , transfer_from or deposit endpoint, so closing this needs a new contract deployment.

Found in QA story 6.05 (external agent execution path), UAT defect D-039, re-verified on the 2026-09-24 re-run. Evidence: <https://github.com/BIOcksmiths/Orizon-Agents-UAT-Stellar/blob/uat/docs/uat/evidence/6.05-external-dispatch.md> · log: <https://github.com/BIOcksmiths/Orizon-Agents-UAT-Stellar/blob/uat/docs/uat/defects.md>

Author

6.03a — still blocked (re-checked 2026-09-24 13:28 UTC)

Independent QA's status, in her words

6.02 is GO, 6.03 is GO on its criteria, 6.04 is NO-GO, and "the epic is not ready to submit." **QA sign-off is pending**, and this submission does not claim it.

Since this was written, the missing demo video (OV-05) was published and the outside registration hashes were linked on the evidence index, both awaiting her re-check. Still open: an outside operator's agent bound to a live endpoint (D-077), and the rest of her register, which the written bundle quotes in full.

Source	https://github.com/BI0cksmiths/Orizon-Agents-UAT-Stellar/blob/main/docs/uat/signoff-report.md
Captured	2026-10-03 16:03 PHT · screenshots/28-uat-epic-6-status.png

Epic 6 status, 2026-10-02

- **6.01 is partial.** The automated suites ran, but the manual wallet x browser matrix (`wallet-browser-matrix.md`) was never run, so no real wallet has been shown to sign on any browser.
- **6.02 is GO on RF-01..RF-17** after the 2026-10-02 re-check: 15 pass, 2 partial, 0 fail. D-027 and D-025 stay open as process items, and D-026 and D-034 as Minor.
- **6.03 is GO on its criteria** (SD-01..SD-08) and stays open until the UI recording 6.03 asks for exists. The 13-second recording in the evidence index (§6.2 D3-c) shows the live receipt, but its dispute was opened through the API by the team's harness, not with the Dispute button.
- **6.04 is NO-GO.** OV-05 fails (no demo video) and OV-08 is blocked (no live outside operator), and five Urgent defects are open against the evidence index and the money path.

The epic is not ready to submit. The shortest path is 6.04's four GO items. The first one, a live outside operator, also unblocks the demo video.
